EDUCATION

University of Washington, Seattle

Seattle, WA | September 2025 – June 2029

B.S. Mechanical Engineering | Intended: Concentration in Mechatronics, Minors in Applied Mathematics, Physics | GPA: 3.7

EXPERIENCE

Racing Force Group, Manufacturing Intern

Bahrain | July 2026 - August 2026

- Researched and documented heat/pressure mapping in heat press molds to identify resin-rich zones contributing to manufacturing defects, presenting my findings to senior engineers
- Performed carbon fiber and fiberglass prepreg layup for an RS7 racing helmet, curing it in a heated platen press with aluminum molds
- Programmed a 2-axis CNC plotter using FKAD software to cut composite material patterns for multiple helmet models
- Soldered microphone and radio communication systems for a Mag-10 rally racing helmet, testing signal output using an amplifier and diagnostic software
- Redesigned a manufacturing jig for securing rubber lining on riot helmet visors, reducing the number of defective pieces caused by uneven adhesive distribution and leakages

UW Autonomous Flight Team

Seattle, WA | October 2025 – Present

Project Lead

August 2026 - Present

- Leading a 5-person team to design, manufacture, and test a quadcopter under fixed budget and design constraints, serving as the first-stage platform for a drone swarm project

Test Stand Team

October 2025 - August 2026

- Designed and manufactured the bearing subsystem and drone mounting plate for an adjustable gyroscopic testing system on SolidWorks, ensuring compatibility with multiple drones and low-friction rotation
- Fabricated carbon fibre components in-house using a prepreg layup process, curing panels in a heated platen press and precision-cutting parts on a waterjet cutter
- Designed and 3D printed a motor mount and assembled a propeller-based test stand that measures the thrust output for the motor of an autonomous quadcopter
- Soldered electrical connections for the motor and ESC, ensuring reliable power delivery during thrust testing

UW Human Powered Submarine, Hull & Drivetrain Team

Seattle, WA | October 2025 – Present

- Fabricated the hull mould using wet carbon fibre layup, cutting and layering sheets to create the structure of the submarine that placed 3rd in the European International Submarine Races (eISR)
- Fabricated test panels through wet fibreglass layup and performed hand calculations, applying buoyancy principles to evaluate structural durability and determine foam thickness distribution across the hull
- Researched fastening methods and screw sizing for the drivetrain mounting plate, and machined the final part for assembly to the submarine

PROJECTS | [View Portfolio](#)

Robotic Arm | July 2026 - Present

- Designing a 5DOF, Arduino controlled robotic arm in SolidWorks that focuses on mechanical linkage geometry and actuator joint mounting for servo motors; 3D printing and assembly in progress
- Calculated shoulder joint torque under a 100 g payload at full extension to select DS3218 servos with a 10% safety margin

SKILLS

CAD: SolidWorks, Fusion 360, 2D Design

Manufacturing: CNC Machining, Laser Cutting, 3D Printing, Composites, Soldering, Injection Molding

Fabrication Tools: Milling machine, Pillar drill, Lathe, Waterjet, Jigsaw, Sanding machine
